

# emStart Final Status Report

**Members:** Ivan Borra, Matthew Gasper, Matthew Grabasch, TJ Scherer, and Matthew Selph

# Project Recap

# Background Recap

- ❖ Emulating system for an existing small radio telescope (SRT) in order to verify its operation as expected this includes its mechanical movement and radio.
- ❖ As an additional requirement is it must also emulate the rotation of the earth during testing.

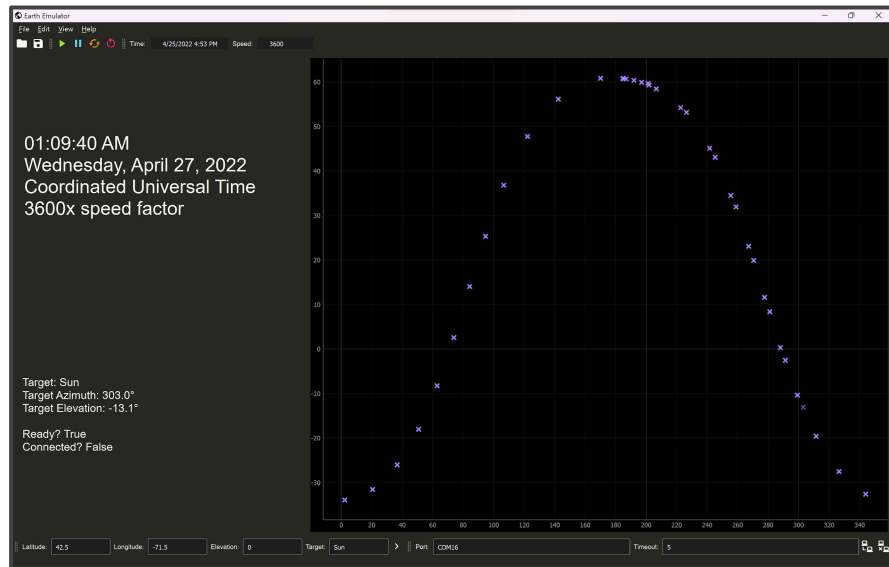

# Hardware Achievements

- ❖ The system has been fully assembled into a compact form for easy transportation and storage.
- ❖ All final preparations have been completed for the full operation of the system as a final product.
- ❖ Attenuator has been connected to the system in order to adjust the incoming RF signal to emulated values.

# Software Achievements

- ❖ The Earth controller software has an optimized and improved user interface that is much clearer.
- ❖ The ROT2Prog interface has been tested using the SRT hardware.
- ❖ The attenuator code decreases the signal strength when the rotator is not pointing towards the target.
- ❖ The system is fully operational from a software perspective.

## Small Radio Telescope

### SRT Inactive

- Motor Az, El: 127.0, 50.0 deg
- Motor Offsets: 0.0, 0.0 deg
- Center Frequency: 1420.0 MHz
- Bandwidth: 2.4 MHz

### Commands

ANTENNA ▾ RADIO ▾ ROUTINE ▾ POWER ▾

N Point Scan Graph

# Final Demo

# Future Goals

- Tune the attenuator for greater accuracy
- Implement time-syncing in the SRT software to improve flexibility
- Further simplification of hardware requirements
